TITLE: Gas exchange dynamics of white mice under conditions of high partial oxygen pressure

SOURCE: Fiziologicheskiy zhurnal SSSR, v. 49, no. 5, 1963, 643-647

TOPIC TAGS: gas exchange, hyperoxia, hypoxia, redox, oxygen

ABSTRACT: Gas exchange dynamics in relation to an organism under hyperoxic conditions is of medical and biological importance but has received little attention. To study this problem experiments were conducted on white mice placed in a glass chamber with an automatic feeder. The chamber was kept under water to maintain a constant temperature (22-23°) and oxygen was supplied automatically. Total amount of carbon dioxide exhaled was determined by titrating the chemical absorber after the experiment. The mice were kept in nitrogen-oxygen mixtures with 60% or 90% oxygen ($O_{\text{sub}} 2$) content for various periods of time. Some mice were taken from a regular air medium to a hyperoxic medium (60% or 90%) and some from a hyperoxic one to a

Card 1/2

12951-63

ACCESSION NR: AP3001505

hypoxic one (% O₂ sub 2). The gas exchange level of mice in a nitrogen-oxygen mixture at first is high and then drops to a level a little higher than normal and remains there. The gas exchange level of mice exposed to hyperoxic conditions for 36 hrs and then moved to a hypoxic medium undergoes a slow decrease. The dynamics of these changes reflect a rearrangement of the redox processes which appears to correspond with sudden changes in the oxygen medium. The author recommends that more detailed studies be made of oxygen concentrations and their effect on the gas exchange level in an organism. Orig. art. has: 2 figures and 1 table.

Distribution of sugars between cells and the surrounding medium. A. S. Troshin (Inst. Exptl. Med., Leningrad). Biokhimiya 16, 114-76 (1951).—Yeasts were suspended in aq. solns. of lactose, and the amt. of sugar adsorbed was measured by its diminution in the medium. At a lactose concn. of 10.6% in the medium, the sugar concn. in the yeasts was 23% less. But at a lactose concn. of 0.13%, the sugar concn. in the yeasts was 7 times greater. The distribution of the sugars arabinose, galactose, and sucrose between the aq. medium and frog muscle was also measured. A similar relationship was found: a very high sugar concn. in the medium resulted in a lower sugar concn. in the muscle tissue, whereas a low sugar concn. in the aq. medium brought about an increased sugar concn. in the muscle, because of adsorption. These results are in disagreement with the membrane theory.
H. Priestley

TITLE:

News in Brief (Kratkiye soobshcheniya) The Second International Conference on the Mechanism of Stimulation (Vtoroye mezhdunarodnoye soveshchaniye po mekhanizmu vozbuздheniya)

PERIODICAL:

Vestnik Akademii nauk SSSR, 1958, Nr 7, pp. 103 - 104 (USSR)

ABSTRACT:

The conference was held at the Humboldt-University (Universitet im. A. Gumbol'dta) in Berlin, in the DDR (German Democratic Republic)(GDR) from March 31 to April 2. It was attended by physiologists, biochemists and biophysicists, who with respect to the mechanism of stimulation, take two different views. One group proceeds from the albumin theory developed by D.N.Nasonov and his students. The other group relies on the principles of the diaphragm theory proposed by A.Hodgkin, and the Cambridge School(kembridzhskaya shkola) of physiologists. 24 reports were submitted. They are partly listed below:

1)V.Ya.Aleksandrova (USSR) on the Albumin Theory of Injury and Stimulation.
2)B.N.Tarusov (USSR) on Electrical Parameters of the Cells in

Different Functional States.

- 3) E. Ernst, Hungary (Vengriya) showed that individual fibrils react to every electrical irritation by a distinctive contraction.
- 4) G.M. Frank, USSR, on Structural Changes in Nerve Fibers Caused by Excitation.
- 5) A. Kaladzhiiyeva, Bulgaria (Bulgariya), A. Wolf (Vol'f), V. Linke, DDR, Ye. M. Makovskiy, Roumania (Rumyniya) investigated the properties of solutions of native albumins.
- 6) G. Vogel (Fogel'), G. Krause (Krauze), G. John (Dzhon), DDR, described the results obtained by the investigation of the influence exercised by temperature and various poisons of fermentation on the monodular (monodal'nyj) active current.
- 7) G. Lippmann, E. Schubert (Shubert), DDR, on the Influence Exercised by Metabolism Upon the Process of Cell-Excitation.
- 8) E. Gutman, Ts. Vodichka, Czechoslovakia (Chechoslovakiya) on Impulseless Processes in Nervous Structures.
- 9) L. Lyubinskaya, Poland (Pol'sha), K. Cheng, China (Kitay), on the Morphological Structure of Some Elements of the Nervous System.

TITLE: Polarization and frequency characteristics of ring lasers with triangular resonators

SOURCE: Optika i spektroskopiya, v. 21, no. 6, 1966, 768-769

TOPIC TAGS: laser, gas laser, ring gas laser, gas laser polarization, gas laser frequency spectrum, laser frequency ~~spectrum~~ characteristic

ABSTRACT: The polarization and frequency characteristics of a triangular He-Ne laser arrangement were experimentally investigated along lines described earlier by Doyle and White (Appl. Phys. Letters. 5, 1964, 193). The arrangement had a perimeter of 363 cm which was formed by three multi-layer dielectric mirrors (the first two flat and the other spherical). Two discharge tubes, 4 mm in diameter, were filled with a 1:5 He-Ne mixture at a pressure of 1.8 mm Hg and operated on the 1.153 μ wavelength. The mode positions were observed by means of an arrangement consisting of a polarization prism, a photomultiplier, and an SCh-9 spectrum analyzer. Beats were observed on the 39-, 43-, and 82-Mc frequencies, the peak intensity of the latter being independent of the

Card 1/2

UDC: 621.375.9:535

ACC NR: AP7002426

turning of the prism around its axis. The peak values of the 39- and 43-Mc beats reached their maxima when the polarization prism was at an angle of 45° to the polarization planes of the system. These peaks disappeared periodically with every 90° turn of the prism. By inserting a birefringent plate (quartz or mica) into the resonator, the difference between the modes could be changed within wide limits. The arrangement is considered convenient for use in studying mode interaction, since Kerr cells, compensators, etc., can be employed to effect a smooth change of the mode difference between zero and its maximum.
